

CereCore Supports MEDITECH Optimization: with Prioritized Assessment Findings

CereCore's team of experts uncovers issues that could be a result of untapped system opportunities as often organizations are implementing old systems with new tools – not taking advantage of the changes in workflow and workstream improvements and changes.

Our assessments find common issues that cause concerns for IT:

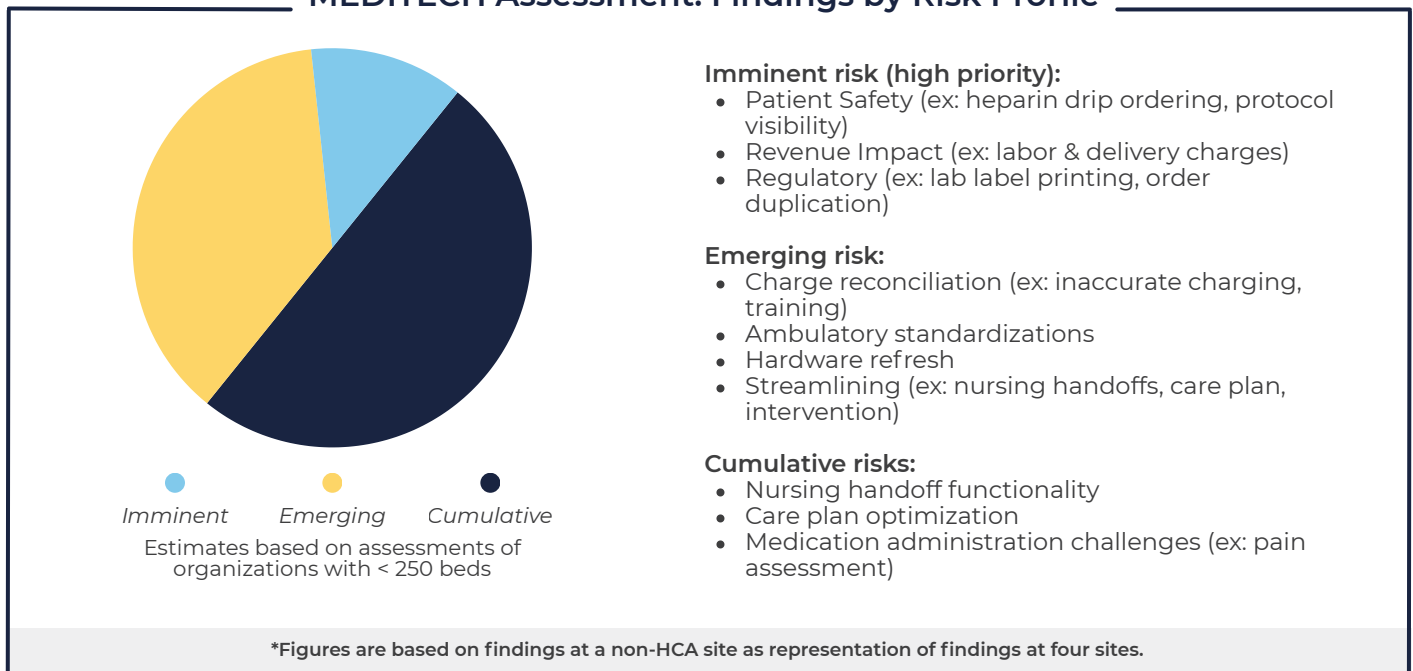

- Functionality that was not addressed during the initial implementation or that was for requirements discovered after go-live.
- Lack of expertise, skilled resources, and governance during upgrades.
- Backlogged maintenance that has built up over time.
- Workarounds and shadow IT that mask issues with efficiency, data accuracy, and potentially the revenue cycle.

Our assessments find millions of dollars in unbilled revenue. We consider setup and workflow design, provide analytics related to improved clinical decision making, and many other ideas to improve patient and provider experiences. Our assessment reports help clients prioritize optimization work and coordinate the effort.

What our MEDITECH Assessments Find

Findings can vary by location based on services delivered, provider preferences accommodated, state regulations in effect, and other factors. Even given the variables, findings can be categorized into these common risk profiles:

MEDITECH Assessment: Findings by Risk Profile

➤ **Imminent risk needs attention ASAP**
Potential to impact safety, revenue, or regulatory compliance, the risk is too great to ignore.

➤ **Address emerging risk to contain the consequences**
Manageable now and are best addressed before escalating to imminent.

➤ **Cumulative risks can compound over time**
Taken individually, these are less concerning. Combined, they can become more disruptive.
